the 1990s, the number of people with a diagnosis of schizophrenia has increased in many countries (1).

There is a growing awareness of the need to improve the quality of life of people with schizophrenia, and the need to address the social and psychological consequences of the illness (2). The World Health Organization (WHO) has developed a number of instruments to measure the quality of life of people with schizophrenia (3).

The WHO Quality of Life (QoL) instrument is a self-rated measure of the quality of life of people with schizophrenia. It consists of 26 items, each rated on a scale from 1 to 5, with 1 being the lowest and 5 being the highest (4).

The WHO QoL instrument has been used in a number of studies of people with schizophrenia. In a study of 100 people with schizophrenia, the mean score on the WHO QoL instrument was 2.8 (5).

In a study of 200 people with schizophrenia, the mean score on the WHO QoL instrument was 2.5 (6). In a study of 300 people with schizophrenia, the mean score on the WHO QoL instrument was 2.2 (7).

The WHO QoL instrument is a useful measure of the quality of life of people with schizophrenia. It is a self-rated measure, and it is easy to use. It is also a valid and reliable measure of the quality of life of people with schizophrenia (8).
